Growth in a Time of Debt  
Carmen M. Reinhart and Kenneth S. Rogoff  
NBER Working Paper No. 15639  
January 2010, Revised January 2010  
JEL No. E2,E3,E6,F3,F4,N10

## ABSTRACT

We study economic growth and inflation at different levels of government and external debt. Our analysis is based on new data on forty-four countries spanning about two hundred years. The dataset incorporates over 3,700 annual observations covering a wide range of political systems, institutions, exchange rate arrangements, and historic circumstances. Our main findings are: First, the relationship between government debt and real GDP growth is weak for debt/GDP ratios below a threshold of 90 percent of GDP. Above 90 percent, median growth rates fall by one percent, and average growth falls considerably more. We find that the threshold for public debt is similar in advanced and emerging economies. Second, emerging markets face lower thresholds for external debt (public and private)—which is usually denominated in a foreign currency. When external debt reaches 60 percent of GDP, annual growth declines by about two percent; for higher levels, growth rates are roughly cut in half. Third, there is no apparent contemporaneous link between inflation and public debt levels for the advanced countries as a group (some countries, such as the United States, have experienced higher inflation when debt/GDP is high). The story is entirely different for emerging markets, where inflation rises sharply as debt increases.

**Debt:GDP ratio**  
**90%+ → -0.1% growth**

# Austerity and Excel

Thomas Herndon

Over time, another problem emerged: Other researchers, using seemingly comparable data on debt and growth, couldn't replicate the Reinhart-Rogoff results. They typically found some correlation between high debt and slow growth — but nothing that looked like a tipping point at 90 percent or, indeed, any particular level of debt.

Finally, Ms. Reinhart and Mr. Rogoff **allowed** [researchers at the University of Massachusetts](#) to look at their original spreadsheet — and [the mystery of the irreproducible results was solved](#). First, they omitted some data; second, they used unusual and highly questionable statistical procedures; and finally, yes, they made an Excel coding error. Correct these oddities and errors, and you get what [other researchers have found](#): some correlation between high debt and slow growth, with no indication of which is causing which, but no sign at all of that 90 percent “threshold.”

From **Paul Krugman, "The Excel Depression"**

## 3.1.2 Data Visualization

We use `ggplot2` as our main package to create ad-hoc exploratory graphics as well as polished-looking customized visualizations. When combined with tools to clean and transform data, `ggplot2` allows analysts to quickly translate insights into high quality, compelling visualizations. In addition to the static graphics of `ggplot2`, we often make interactive visualizations or dashboards using R packages such as `plotly` (Sievert et al. 2017), `leaflet` (Cheng et al. 2017), `dygraphs` (Vanderkam et al. 2017), `DiagrammeR` (Sveidqvist et al. 2017), and `shiny` (Chang et al. 2017).

## 3.1.3 Reproducible Research

At Airbnb, all R analyses are documented in `rmarkdown`, where code and visualizations are combined within a single written report. Posts are carefully reviewed by experts in the content area and techniques used, both in terms of methodologies and code style, before publishing and sharing with the business partners. The peer review process is

The UK's reproducible analysis pipeline

Airbnb, ggplot, and rmarkdown

# Amounts

# Yay bar plots!

We are a lot better at visualizing line lengths than angles and areas

# Oh no bar plots!

# Start at zero

**The entire line length matters,  
so don't truncate it!**

**Always start at 0**

**(Or don't use bars)**

# Bar plots and summary statistics

#barbarplots

# Bar plots and summary statistics

# Show more data with strip plots

```
ggplot(animals,  
      aes(x = animal_type,  
          y = weight,  
          color = animal_type)) +  
  geom_point(position = position_jitter(height = 1),  
            size = 1) +  
  labs(x = NULL, y = "Weight") +  
  guides(color = "none")
```

# Show more data with beeswarm plots

```
library(ggbeeswarm)

ggplot(animals, aes(x = animal_type,
                    y = weight,
                    color = animal_type)) +
  geom_beeswarm(size = 1) +
  # Or try this too:
  # geom_quasirandom() +
  labs(x = NULL, y = "Weight") +
  guides(color = "none")
```

# Combine boxplots with points

```
ggplot(animals, aes(x = animal_type,  
                    y = weight,  
                    color = animal_type)) +  
  geom_boxplot(width = 0.5) +  
  geom_point(position = position_jitter(height = 0.5),  
            size = 1, alpha = 0.5) +  
  labs(x = NULL, y = "Weight") +  
  guides(color = "none")
```

# Combine violins with points

```
ggplot(animals, aes(x = animal_type,  
                    y = weight,  
                    color = animal_type)) +  
  geom_violin(width = 0.5) +  
  geom_point(position = position_jitter(height =  
    size = 1, alpha = 0.5) +  
  labs(x = NULL, y = "Weight") +  
  guides(color = "none")
```

# Overlapping ridgeplots

```
library(ggribes)\n\n  ggplot(animals, aes(x = weight,\n                      y = animal_type,\n                      fill = animal_type)) +\n    geom_density_ridges() +\n    labs(x = "Weight", y = NULL) +\n    guides(fill = "none")
```

# General rules

**Bar charts always start at zero**

**Don't use bars for summary statistics.  
You throw away too much information.**

**The end of the bar is often all that matters**

# Lots of alternatives

We'll use a summarized version of the gapminder dataset as an example

```
library(gapminder)
gapminder_continents <- gapminder |>
  filter(year == 2007) |> # Only look at 2007
  count(continent) |> # Get a count of continents
  arrange(desc(n)) |> # Sort descendingly
  # Make continent into an ordered factor
  mutate(continent = fct_inorder(continent))

ggplot(gapminder_continents,
       aes(x = continent, y = n, fill = continent)) +
  geom_col() +
  guides(fill = "none") +
  labs(x = NULL, y = "Number of countries")
```

# Alternatives: Lollipop charts

Since the end of the bar is important, emphasize it the most

```
ggplot(gapminder_continents,  
       aes(x = continent, y = n,  
           color = continent)) +  
  geom_pointrange(aes(ymin = 0, ymax = n)) +  
  guides(color = "none") +  
  labs(x = NULL, y = "Number of countries")
```

# Alternatives: Waffle charts

Show the individual observations as squares

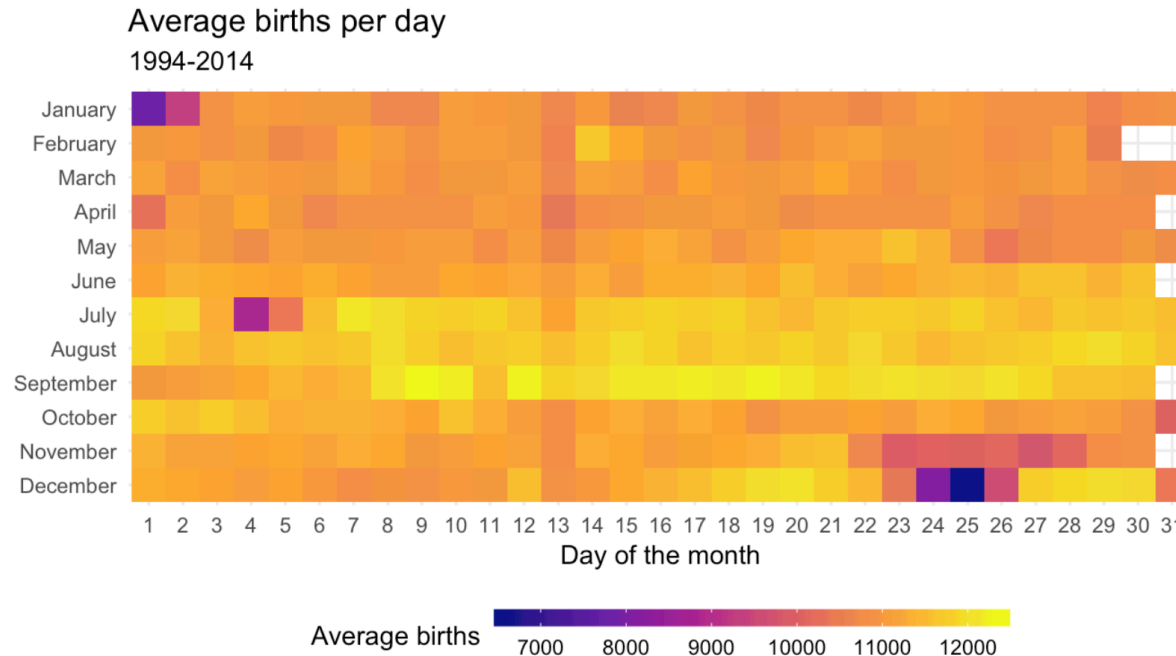

```
# This has to be installed in a special way--
# Run this in your console:
# devtools::install_github("hrbrmstr/waffle")
library(waffle)

ggplot(gapminder_continents,
       aes(x = continent, y = n,
           fill = continent)) +
  geom_waffle(aes(values = n), # geom_waffle
             n_rows = 9, # It has lots of
             flip = TRUE, na.rm = TRUE) +
  labs(fill = NULL) +
  coord_equal() + # Make all the squares square
  theme_void() # Use a completely empty theme
```

# Alternatives: Heatmaps

If exact counts are less important,  
try a heatmap with `geom_tile()`

# Proportions

# Why proportions?

Sometimes we want to compare values across a whole population instead of looking at raw counts

Only do this when it makes analytical sense!

**COVID-19 amounts vs. proportions**

# Pie charts

Perceptual issues with angle and fill space

Only okay(ish) if there are a few easily distinguishable categories

# Alternatives

Bar plots

Any of the alternatives to bar plots

Treemaps and mosaic plots  
(but these can still be really hard to interpret)
